Evaluating Pure Spinor Superspace Expressions

- Four gravitons at two-loops
- Anomaly Kinematical Factor

- Compute the kinematical factors of amplitudes obtained with the pure spinor formalism
 - PRL 96 (2006),011602 (Berkovits,C.M.)
 - JHEP 0601 (2006), 075 (C.M.)
 - JHEP 0611 (2006), 079 (Berkovits,C.M.)
- Check if they agree with RNS and GS results
 - For example, the 4-point 1-loop kinematical factor:

 $\langle (\lambda A^1)(\lambda \gamma^m W^2)(\lambda \gamma^n W^3) \mathcal{F}_{mn}^4 \rangle + \text{perm}(234) = t_8 F^4 + \text{fermions}$

• Or the 4-point amplitude at 2-loops

 $\langle (\lambda \gamma^{mnpqr} \lambda) \mathcal{F}_{nn}^{1} \mathcal{F}_{pq}^{2} \mathcal{F}_{rs}^{3} (\lambda \gamma^{s} W^{4}) \rangle + \text{perm}(1234) = (t - u)t_{8}F^{4} + \dots$

• Or the gauge variation of the 6-point amplitude at 1-loop

$$\langle (\lambda \gamma^m W) (\lambda \gamma^n W) (\lambda \gamma^\rho W) (W \gamma_{mnp} W) \rangle = \epsilon_{10} F^5$$

Or how to prove the following interesting identity

$$\langle (\lambda \gamma^{r} \gamma^{m_{1}n_{1}} \theta) (\lambda \gamma^{s} \gamma^{m_{2}n_{2}} \theta) (\lambda \gamma^{t} \gamma^{m_{3}n_{3}} \theta) (\theta \gamma^{m} \gamma^{n} \gamma_{rst} \gamma^{m_{4}n_{4}} \theta) \rangle =$$
$$= -\frac{2}{45} \left(\eta^{mn} t_{8}^{m_{1}n_{1}m_{2}n_{2}m_{3}n_{3}m_{4}n_{4}} - \frac{1}{2} \epsilon_{10}^{mnm_{1}n_{1}m_{2}n_{2}m_{3}n_{3}m_{4}n_{4}} \right)$$

Find tricks and shortcuts to compute general scattering amplitudes
 Note: Compact notation t₈F⁴ means

$$t_8 F^4 \equiv 4(F^1 F^2 F^3 F^4) + 4(F^1 F^3 F^2 F^4) + 4(F^1 F^2 F^4 F^3)$$
$$-(F^1 F^2)(F^3 F^4) - (F^1 F^3)(F^2 F^4) - (F^1 F^2)(F^4 F^3)$$

The pure spinor formalism is a CFT based on the following action

Action (Minimal Pure Spinor Formalism)

$$S = \int d^2 z \left(\frac{1}{2} \partial X^m \overline{\partial} X_m + p_\alpha \overline{\partial} \theta^\alpha - w_\alpha \overline{\partial} \lambda^\alpha \right)$$

With a bosonic pure spinor λ^{α}

Constraints

$$(\lambda \gamma^m \lambda) = \mathbf{0}$$

Some important definitions for amplitude computations:

Lorentz current

$$N^{mn} = \frac{\alpha'}{4} (w \gamma^{mn} \lambda)$$

• Supersymmetric momentum

$$\Pi^m = \partial X^m + \frac{1}{2} (\theta \gamma^m \partial \theta)$$

Supersymmetric derivative

$$D_{\alpha} = \frac{\partial}{\partial \theta^{\alpha}} + \frac{1}{2} (\theta \gamma^{m})_{\alpha} \partial_{m}$$

• Supersymmetric Green-Schwarz constraint

$$d_{\alpha} = \frac{\alpha'}{2} p_{\alpha} - \frac{1}{2} (\gamma^{m} \theta)_{\alpha} \partial X_{m} - \frac{1}{8} (\gamma^{m} \theta)_{\alpha} (\theta \gamma_{m} \partial \theta)$$

C.R. Mafra (IFT)

Relevant OPE's

$$X^{m}(z,\overline{z})X^{n}(w,\overline{w}) \longrightarrow -\frac{1}{2}\eta^{mn}\ln|z-w|^{2}$$

$$N^{mn}(z)\lambda^{\alpha}(y) \longrightarrow \frac{\alpha'}{4}\frac{(\gamma^{mn}\lambda)^{\alpha}}{z-y}$$

$$d_{\alpha}(z)V(y,\theta) \longrightarrow \frac{D_{\alpha}V(y,\theta)}{z-y}$$

$$\Pi^{m}(z)V(y,\theta) \longrightarrow \frac{\partial^{m}V(y,\theta)}{z-y}$$

Prescription for Scattering Amplitudes

- Massless Vertex Operators:
 - Unintegrated

$$V = \lambda^{lpha} A_{lpha}(X, heta)$$

Integrated

$$U = \int dz \left(\partial \theta^{\alpha} A_{\alpha} + A_m \Pi^m + d_{\alpha} W^{\alpha} + \frac{1}{2} N^{mn} \mathcal{F}_{mn} \right)$$

Where A_α(x, θ), A_m(x, θ), W^α(x, θ) and F_{mn}(x, θ) are the SYM superfields.

.

A D M A A A M M

• The prescription for tree-level amplitudes is given by

Tree-level N-point

$$\mathcal{A}_N = \langle V_1(z_1) V_2(z_2) V_3(z_3) \int dz_4 U_4(z_4) \dots \int dz_N U_N(z_N) \rangle$$

- Computation proceeds as usual in a CFT
- Use OPE's to integrate out conformal weight 1 variables
- Then integrate out zero-modes

A D b 4 A b

• For our purposes now, integration over λ^{α} and θ^{α} zero-modes is done with the rule

 $\lambda^3 \theta^5$ prescription

$$\langle (\lambda \gamma^m \theta) (\lambda \gamma^n \theta) (\lambda \gamma^p \theta) (\theta \gamma_{mnp} \theta) \rangle = 1$$

- The computation of scattering amplitudes gives rise to pure spinor superspace expressions
- Compact way of writing the full amplitude
 - Contain all possible contributions of fermionic and bosonic external states
- To compare results with RNS/GS one has to express these pure spinor expressions in terms of polarization and momenta
- This is now a solved problem:
 - Systematic procedure to evaluate pure spinor superspace expressions in components
 - I have made Mathematica functions that make this job

Four gravitons at tree-level

Example

$$\mathcal{A} = \langle V^{1}(z_{1}, \overline{z}_{1}) V^{2}(z_{2}, \overline{z}_{2}) V^{3}(z_{3}, \overline{z}_{3}) \int_{\mathbb{C}} d^{2}z U^{4}(z, \overline{z}) \rangle$$

where $V^{i}(z, \overline{z}) = V^{i}(z) \otimes \tilde{V}^{i}(\overline{z}) e^{ik \cdot X}$ and $U(z, \overline{z}) = U(z) \otimes \tilde{U}(\overline{z}) e^{ik \cdot X}$

2

イロト イヨト イヨト イヨト

Sidenote

Previous computation (Policastro, Tsimpis 2006) were done in a way that hided the simplicity of the result. Cancellations were overlooked and no simple pure spinor expression was written down for the kinematical factor.

We have to compute

$$\langle (\lambda A^1)(z_1)(\lambda A^2)(z_2)(\lambda A^3)(z_3) \int d^2 z (\Pi^m A_m^4 + (dW^4) + \frac{1}{2} N^{mn} \mathcal{F}_{mn}) \rangle$$

⊗(right-moving part)

• SL(2,C) invariance allows the fixing $z_1 = 0$, $z_2 = 1$ and $z_3 \rightarrow \infty$

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

• $\Pi^m A_m^4$ term of integrated vertex contribute only with

$$\langle (\lambda A^1)(\lambda A^2)(\lambda A^3)A_m^4\Pi^m: e^{ik_1X}::e^{ik_2X}:e^{ik_3X}:e^{ik_4X}:\rangle =$$

$$=\sum_{i=1}^{2}\frac{\alpha'}{2}\frac{ik_{i}^{m}}{z_{i}-z_{4}}\langle(\lambda A^{1})(\lambda A^{2})(\lambda A^{3})A_{m}^{4}\rangle\otimes\Pi(z_{ij})$$

4 D b 4 A b

- One can use some identities to simplify result of other OPE's
- Delay as long as possible explicit evaluation of pure spinor integrals

Lemma

One can show the OPE identity

$$\langle (\lambda A^1)(\lambda A^2)(\lambda A^3)((dW^4) + \frac{1}{2}N^{mn}\mathcal{F}_{mn}) \rangle =$$

$$+\frac{\alpha'}{2(z_1-z_4)}\langle A^1_m(\lambda A^2)(\lambda A^3)(\lambda \gamma^m W^4)\rangle-(1\leftrightarrow 2)+(1\leftrightarrow 3)$$

.

A D M A A A M M

Tree-level 4-graviton computation

• We organize the computation as

$$\mathcal{A} = \operatorname{const} \int d^2 z_4 \left(\frac{F_1}{z_1 - z_4} + \frac{F_2}{z_2 - z_4} \right) \otimes \left(\frac{\tilde{F}_1}{\overline{z}_1 - \overline{z}_4} + \frac{\tilde{F}_2}{\overline{z}_2 - \overline{z}_4} \right)$$
$$\cdot |z_4|^{-\alpha' t/2} |1 - z_4|^{-\alpha' u/2}$$

where

$$F_{1} = ik_{m}^{1} \langle (\lambda A^{1})(\lambda A^{2})(\lambda A^{3})A_{m}^{4} \rangle + \langle A_{m}^{1}(\lambda A^{2})(\lambda A^{3})(\lambda \gamma^{m} W^{4}) \rangle$$

$$F_{2} = ik_{m}^{2} \langle (\lambda A^{1})(\lambda A^{2})(\lambda A^{3})A_{m}^{4} \rangle - \langle (\lambda A^{1})A_{m}^{2}(\lambda A^{3})(\lambda \gamma^{m} W^{4}) \rangle$$

Image: A matrix

Tree-level 4-graviton computation

• Using the general formula

$$\int d^2 z z^A (1-z)^B \overline{z}^{\tilde{A}} (1-\overline{z})^{\tilde{B}} = 2\pi \frac{\Gamma(1+A)\Gamma(1+B)}{\Gamma(2+A+B)} \cdot \frac{\Gamma(-1-\tilde{A}-\tilde{B})}{\Gamma(-\tilde{A})\Gamma(-\tilde{B})}$$

we get

$$\mathcal{A} = \mathcal{K}\tilde{\mathcal{K}} \frac{\Gamma(-\alpha't/4)\Gamma(-\alpha'u/4)\Gamma(-\alpha's/4)}{\Gamma(1+\alpha's/4)\Gamma(1+\alpha't/4)\Gamma(1+\alpha'u/4)}$$

where

$$K = uF_1 - tF_2 \qquad \tilde{K} = u\tilde{F}_1 - t\tilde{F}_2$$

Pure Spinor Superspace Result

$$\mathcal{A} = \mathcal{K} \otimes ilde{\mathcal{K}} rac{\Gamma(-s/4)\Gamma(-t/4)\Gamma(-u/4)}{\Gamma(1+s/4)\Gamma(1+t/4)\Gamma(1+u/4)}$$

where the kinematical factor is given by

$$\begin{split} \mathcal{K} &= \langle \partial^{n} (\lambda A^{1}) \partial^{m} (\lambda A^{2}) (\lambda A^{3}) \mathcal{F}_{mn}^{4} \rangle \\ &+ \langle (\partial_{p} A_{m}^{1}) (\lambda A^{2}) \partial^{p} (\lambda A^{3}) (\lambda \gamma^{m} W^{4}) \rangle \\ &+ \langle (\lambda A^{1}) (\partial_{p} A_{m}^{2}) \partial^{p} (\lambda A^{3}) (\lambda \gamma^{m} W^{4}) \rangle \end{split}$$

Evaluating Pure Spinor Superspace Expressions

C.R. Mafra (IFT)

Journal Club at UNC 24 / 46

- Pure spinor superspace expressions are compact and elegant
- However, until the Pure Spinor Formalism becomes the *de facto* standard superstring formalism, one needs to check the results in components
- Straightforward to do with the $(\lambda^3 \theta^5)$ rule

$\lambda^3 \theta^5$ prescription

 $\langle (\lambda \gamma^m \theta) (\lambda \gamma^n \theta) (\lambda \gamma^p \theta) (\theta \gamma_{mnp} \theta) \rangle = 1$

A B F A B F

 Suppose one wants to compute the 1-loop pure spinor superspace integral

 $\langle (\lambda A)(\lambda \gamma^m W)(\lambda \gamma^n W)\mathcal{F}_{mn} \rangle$

We first expand superfields in θ's as follows

Evaluating Pure Spinor Superspace Expressions

SYM Superfields θ -Expansion

$$\begin{aligned} A_{\alpha}(x,\theta) &= \frac{1}{2} a_{m}(\gamma^{m}\theta)_{\alpha} - \frac{1}{3} (\xi\gamma_{m}\theta)(\gamma^{m}\theta)_{\alpha} - \frac{1}{32} F_{mn}(\gamma_{p}\theta)_{\alpha} (\theta\gamma^{mnp}\theta) + \dots \\ A_{m}(x,\theta) &= a_{m} - (\xi\gamma_{m}\theta) - \frac{1}{8} (\theta\gamma_{m}\gamma^{pq}\theta) F_{pq} + \frac{1}{12} (\theta\gamma_{m}\gamma^{pq}\theta)(\partial_{p}\xi\gamma_{q}\theta) + \dots \\ W^{\alpha}(x,\theta) &= \xi^{\alpha} - \frac{1}{4} (\gamma^{mn}\theta)^{\alpha} F_{mn} + \frac{1}{4} (\gamma^{mn}\theta)^{\alpha} (\partial_{m}\xi\gamma_{n}\theta) \\ &\quad + \frac{1}{48} (\gamma^{mn}\theta)^{\alpha} (\theta\gamma_{n}\gamma^{pq}\theta) \partial_{m}F_{pq} + \dots \\ \mathcal{F}_{mn}(x,\theta) &= F_{mn} - 2 (\partial_{[m}\xi\gamma_{n]}\theta) + \frac{1}{4} (\theta\gamma_{[m}\gamma^{pq}\theta)\partial_{n]}F_{pq} + \dots, \end{aligned}$$

C.R. Mafra (IFT)

3 > 4 3

A D M A A A M M

- Remember that correlator must have 5 θ 's to be non-zero
- If we want the bosonic contribution we distribute θ's as follows

$A_{\alpha}(\theta)$	$W^{lpha}(heta)$	$W^{lpha}(heta)$	$\mathcal{F}_{mn}(heta)$
1	1	1	2
1	1	3	0
1	3	1	0
3	1	1	0

Sidenote

Previous computation (Anguelova, Grassi, Vanhove 2004) was wrong. Omitted first three lines of above table.

- In JHEP 0601 (2006) (C.M.) it was shown that to get the right result one also has to include the first three lines.
- In JHEP 0705 (2007) (C. Stahn) the fermionic contributions were also computed.

Evaluating Pure Spinor Superspace Expressions

Considering all lines of the table we get

$$\begin{split} & \mathcal{K}_{1}^{NS} = +\frac{15}{64} \mathcal{F}_{mn}^{1} \mathcal{F}_{pq}^{2} \mathcal{F}_{rs}^{3} \mathcal{F}_{tu}^{4} \langle (\lambda \gamma^{[t|} \gamma^{pq} \theta) (\lambda \gamma^{|u]} \gamma^{rs} \theta) (\lambda \gamma_{a} \theta) (\theta \gamma^{mna} \theta) \rangle + \\ & +\frac{15}{16} (k_{m}^{4} e_{n}^{1}) \mathcal{F}_{pq}^{2} \mathcal{F}_{rs}^{3} \mathcal{F}_{tu}^{4} \langle (\lambda \gamma^{[m|} \gamma^{pq} \theta) (\lambda \gamma^{|a]} \gamma^{rs} \theta) (\lambda \gamma^{n} \theta) (\theta \gamma_{a} \gamma^{tu} \theta) \rangle + \\ & +\frac{5}{16} (k_{m}^{2} e_{n}^{1}) \mathcal{F}_{pq}^{2} \mathcal{F}_{rs}^{3} \mathcal{F}_{tu}^{4} \langle (\lambda \gamma^{[t|} \gamma^{ma} \theta) (\lambda \gamma^{|u]} \gamma^{rs} \theta) (\lambda \gamma^{n} \theta) (\theta \gamma_{a} \gamma^{pq} \theta) \rangle + \\ & +\frac{5}{16} (k_{m}^{3} e_{n}^{1}) \mathcal{F}_{pq}^{2} \mathcal{F}_{rs}^{3} \mathcal{F}_{tu}^{4} \langle (\lambda \gamma^{[t|} \gamma^{pq} \theta) (\lambda \gamma^{|u]} \gamma^{ma} \theta) (\lambda \gamma^{n} \theta) (\theta \gamma_{a} \gamma^{rs} \theta) \rangle. \end{split}$$

< ____

Evaluating Pure Spinor Superspace Expressions

Practical Question

How do we compute $\langle (\lambda \gamma^{[t|} \gamma^{pq} \theta) (\lambda \gamma^{|u|} \gamma^{rs} \theta) (\lambda \gamma_a \theta) (\theta \gamma^{mna} \theta) \rangle$ or

$$\langle (\lambda \gamma^m \gamma^{m_1 n_1} \theta) (\lambda \gamma^n \gamma^{m_2 n_2} \theta) (\lambda \gamma^p \gamma^{m_3 n_3} \theta) (\theta \gamma^{m_4 n_4} \gamma_{mnp} \gamma^{m_5 n_5} \theta) \rangle$$

$$\langle (\lambda \gamma^m \theta) (\lambda \gamma^a \gamma^{m_1 n_1} \theta) (\lambda \gamma^{bcn} \gamma^{m_2 n_2} \theta) (\theta \gamma^{m_3 n_3} \gamma_{abc} \gamma^{m_4 n_4} \theta) \rangle$$

in general?

- One has to relate a general pure spinor superspace expression to $\langle (\lambda \gamma^m \theta) (\lambda \gamma^n \theta) (\lambda \gamma^p \theta) (\theta \gamma_{mnp} \theta) \rangle$
- One can always do that by symmetry arguments
- Example:

$$\langle (\lambda \gamma^m \theta) (\lambda \gamma^n \theta) (\lambda \gamma^p \theta) (\theta \gamma_{ijk} \theta) \rangle = \frac{1}{120} \delta^{mnp}_{ijk}$$

Identities

•
$$(\lambda\gamma^{m}\gamma^{np}\theta) = (\lambda\gamma^{mnp}\theta) + \eta^{mn}(\lambda\gamma^{p}\theta) - \eta^{mp}(\lambda\gamma^{n}\theta)$$

• $(\lambda\gamma^{abc}\gamma^{de}\theta) = +(\lambda\gamma^{abcde}\theta) - 2\delta^{bc}_{de}(\lambda\gamma^{a}\theta) + 2\delta^{ac}_{de}(\lambda\gamma^{b}\theta) - 2\delta^{ab}_{de}(\lambda\gamma^{c}\theta)$
 $-\delta^{c}_{e}(\lambda\gamma^{abd}\theta) + \delta^{c}_{d}(\lambda\gamma^{abe}\theta) + \delta^{b}_{e}(\lambda\gamma^{acd}\theta) - \delta^{b}_{d}(\lambda\gamma^{ace}\theta)$
 $-\delta^{a}_{e}(\lambda\gamma^{bcd}\theta) + \delta^{a}_{d}(\lambda\gamma^{bce}\theta)$
• $(\theta\gamma^{m_{4}n_{4}}\gamma_{mnp}\gamma^{m_{5}n_{5}}\theta) = G^{m_{4}n_{4}m_{5}n_{5}}_{mnpr_{1}r_{2}r_{3}}(\theta\gamma^{r_{1}r_{2}r_{3}}\theta)$ where
 $G^{m_{4}n_{4}m_{5}n_{5}}_{mnpr_{1}r_{2}r_{3}} = +\frac{1}{6}\epsilon^{mm_{4}m_{5}nn_{4}n_{5}}\rho^{r_{1}r_{2}r_{3}} - 24\delta^{np}_{n_{4}n_{5}}\delta^{mm_{4}m_{5}}_{r_{1}r_{2}r_{3}} + 12\delta^{m_{5}n_{5}}_{n_{5}}\delta^{mm_{4}n}_{r_{1}r_{2}r_{3}} - 6\delta^{m_{4}n_{4}}_{np}\delta^{mm_{5}n_{5}} - 2\delta^{m_{4}n_{4}}_{m_{5}n_{5}}\delta^{mnp}_{r_{1}r_{2}r_{3}} + [mnp] + [m_{4}n_{4}] + [m_{5}n_{5}],$
